GERINGHOFF NORTH AMERICA BUILDS WORLD'S LARGEST CORN HEADER

Geringhoff North America announces the production of the world's largest corn header. A massive 24 row 20" Northstar model has been released to the North American corn producers with the first retailed unit set to be delivered to a grower in southeastern North Dakota in August of 2007.

Competing directly with the main line manufacturers of North America, the North Dakota built product is marketed as the NorthStar brand of the Geringhoff product line. Production of the Northstar corn headers began in the fall of 2005 and the Minot ND assembly facility is running at full capacity to fill the demands North American corn growers.

The president and CEO of the Minot ND company is Joseph Jandrisch who remarked, "...we are extremely pleased with the release of this new model. Our company is fortunate to employ people with an exceptional work ethic, along with world class management and service skills. The NorthStar model provides the North American corn grower with the world's finest corn harvesting equipment at an extremely competitive price."

The Northstar 24 row 20" model boasts 33% more capacity than any other competitor while maintaining the lowest weight ratio and horsepower demand. Company officials comment, "Combines are getting larger, growers are farming more acres, and they have demanded the capacity that this and our other larger models will offer. Combines are more efficient when running at full capacity and with our larger models we are able to fill the void that other manufacturers cannot. With varying header sizes and combine models there are over 10,000 combinations and we are the only manufacturer in the world that can fill all of them." The Northstar model is available from 4 to 24 rows in rigid models and 4 to 18 rows with folding frames. Both rigid and folding models are available with row spacings from 20" to 38" and color matched to the producer's combine. The North Dakota company offers dozens of standard features that make the Northstar brand the true market leader.

Geringhoff was established in 1880 and has been an industry leader in the development and manufacturing of corn headers since the 1950's. Geringhoff also manufactures the Rota Disc which is North America's and the world's #1 selling corn header with an integrated stalk destruction system. Geringhoff products are consistently recognized as the industry's highest quality and are marketed in over 30 countries worldwide.
